

Manually add another marker to the map with your `createMarker` function. Make this marker a nearby location of interest. Don't worry about using the input box for now, just hard code it in. You can find the latitude and longitude by going to google maps, typing in an address, and then grabbing the coordinate from the address bar.

Add a marker to the map for each place that the user searches for. Remember you can use your `createMarker` function to do this. Where should this go? Well, probably the callback for the `place_changed` event we just created.
